

MOBILE APP DEVELOPMENT WITH JQUERY MOBILE

Dr. Christelle Scharff

Pace University

cscharff@pace.edu

Mobile browsers

- Different types of mobile browsers
 - Focus navigation (highlight of the selected area), cursor navigation (simulation of a cursor), touch navigation, multi-touch navigation (gestures)
- Zoom
 - Basic zoom (font size only), smart zoom (images and pages as a whole)
- Reflow engines
 - Reflowing the pages to a one-column scrollable
- Multi-page experience
 - How many pages can be open at the same time?
- WebKit Engine
 - Open source layout engine for web browsers that render HTML and CSS and execute JavaScript
 - Used in the current browsers (e.g., Android, iOS...)

Mobile browsers

- Pre-installed

- Safari on iOS – WebKit-based browser
- Android browser - WebKit-based browser
- Chrome for Android - Launched in February 2012
<http://googleblog.blogspot.com/2012/02/introducing-chrome-for-android.html>
- Internet Explorer Mobile

- User-installed

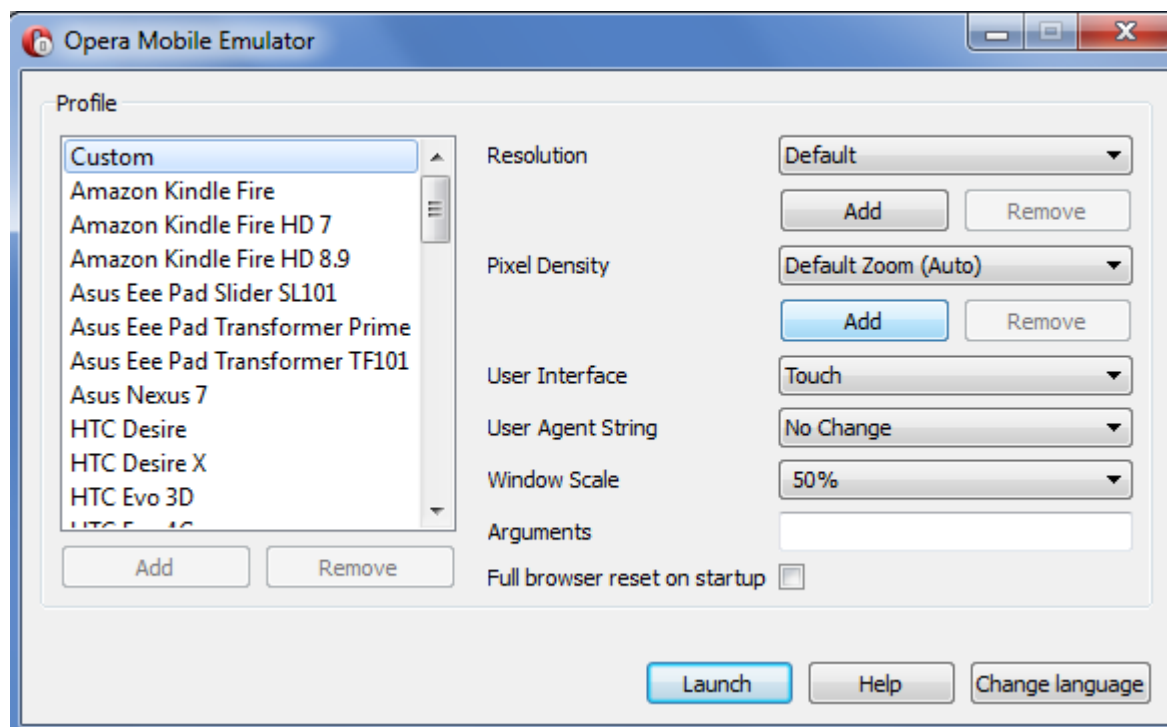

- Firefox mobile – Appeared in 2011 <http://mozilla.com/mobile>
- Opera – Downloadable for most platforms, full browser
<http://www.opera.com/developer/tools/mobile/>
- Opera Mini – Proxy browser that supports videos, Ajax, offline / online... <http://www.opera.com/developer/tools/mini>

INSTALL MOBILE BROWERS ON YOUR PHONE

There are more mobile browsers than you think!

INSTALL THE OPERA MOBILE EMULATOR

<http://www.opera.com/developer/mobile-emulator>

WHAT MOBILE BROWSERS ARE SUBSCRIBERS USING IN THE US AND GLOBALLY?

Mobile browsers - statistics

- What mobile browsers are people using in different parts of the world?
- <http://gs.statcounter.com>

Toolbox

Toolbox

- Editor
 - Notepad++, SublimeText or other
- Browsers
 - Google Chrome
 - Opera mobile emulator
 - Mobile browsers on your phone
- File transfer
 - Filezilla (or equivalent)
- Git and GitHub
 - <http://git-scm.com> and <http://github.com>
- Documentation
 - <http://jquerymobile.com> and <http://stackoverflow.com/>
- Java
 - <http://java.sun.com/javase/downloads/index.jsp>
- Android SDK
 - Android SDK (with Android Studio) <http://developer.android.com>

What is HTML5?

- HTML5 is a core technology markup language of the Internet used for structuring and presenting content for the World Wide Web on all platforms
 - Desktops, phones, TVs...
- HTML5 is mobile (optimized)
 - Phones and tablets
 - Size of UI components
- HTML5 is open
 - HTML is already known by lots of people
 - Soon a standard of W3C (World Wide Web Consortium)
- HTML5 is capable
 - Networking, contacts, online / offline, input, videos and geolocation capabilities
- HTML5 is flexible
 - Content (HTML)
 - Style (CSS)
 - Logic (JavaScript)

HTML in one slide

- HTML = Hyper Text Markup Language
- Language based on tags and rendered by a browser
- Files with html extension
- index.html is the entry file in a web site
- Skeleton of an HTML page

```
<html>
  <head>
    <title>
      ...
    </title>
  </head>
  <body>
    ..
  </body>
</html>
```

Open the tag

Close the tag

Html – cheat sheet
<http://bit.ly/tZpQL>

Tags

`<p> ... </p>` - paragraph
` ... ` - italic
` ... ` - bold
`<h1> ... </h1>` - level of title
(from 1 to 6)
`` - image
`<a> ... ` - link
`
` - blank line
`` - list
 ` ... `
 ` ... `
``
`<div> ... </div>`

CREATE AN HTML FILE AND
OPEN IT IN GOOGLE
CHROME

PUT THE FILE ON THE
SERVER AND OPEN IT IN A
MOBILE DEVICE

E.g., <http://webpage.pace.edu>

CSS in one slide

- CSS = Cascading Style Sheets
- For the visual presentation of an HTML document (text color, size, style, layout, gradients, opacity etc)
- Files with css extension
- Integrate CSS:
 - `<style type="text/css">`
 `body {color:red;}`
 `</style>`
 - OR
 - `<link rel="stylesheet" href="style.css" type="text/css">`
- Based on applying rules on specific elements (selectors). Rules assign values to properties

Inline

External file

- Example 1: `body {color:red; font-style:italic;}`
- Example 2:

CSS – cheat sheet
<http://bit.ly/O0fMmZ>

```
<h1 class="loud">Hi!</h1>
<p id="low">How are you?</p>
<ul>
  <li class="loud">Pizza</li>
  <li>Soda</li>
</ul>
```

Class:
`.loud {font-style: bold;}`

Id:
`#low{font-style:italic;}`
(ids are unique)

CREATE AN HTML FILE AND A
CSS FILE TO STYLE IT

JavaScript in one slide

- JavaScript is a scripting language that permits to make pages more interactive for users

- Examples:

- Form validation
- Show and hide elements
- Database interactions
- Animations

JavaScript – cheat sheet

<http://bit.ly/ivbzJ>

- Files with js extension

- Integrate JavaScript:

```
<script type="text/javascript" charset="utf-8">  
</script>
```

Inline

- OR

```
<script type="text/javascript" src="file.js"></script>
```

External file

Example

```
<script type="text/javascript" charset="utf-8">  
    function showAlert(){  
        alert("Hello");  
    }
```

- ```
</script>
```

```
<button type="button" onclick="showAlert()">
```

Click me!

```
</button>
```

# JQUERY MOBILE

---

# What is jQuery mobile?

- <http://jquerymobile.com>
- To help designers and developers create mobile web experiences easily
- Separation of HTML, CSS and JavaScript
- To create unified user experiences across popular platforms
- Based on HTML5 and a powerful theme mechanism
- Lightweight code built with progressive enhancement
  - Taking advantage of features detected within the browser
- Plugins available (e.g., maps and RSS feeds)
- Code can be packaged in a native app
- Sponsorship from Adobe, Mozilla Corporation, etc.

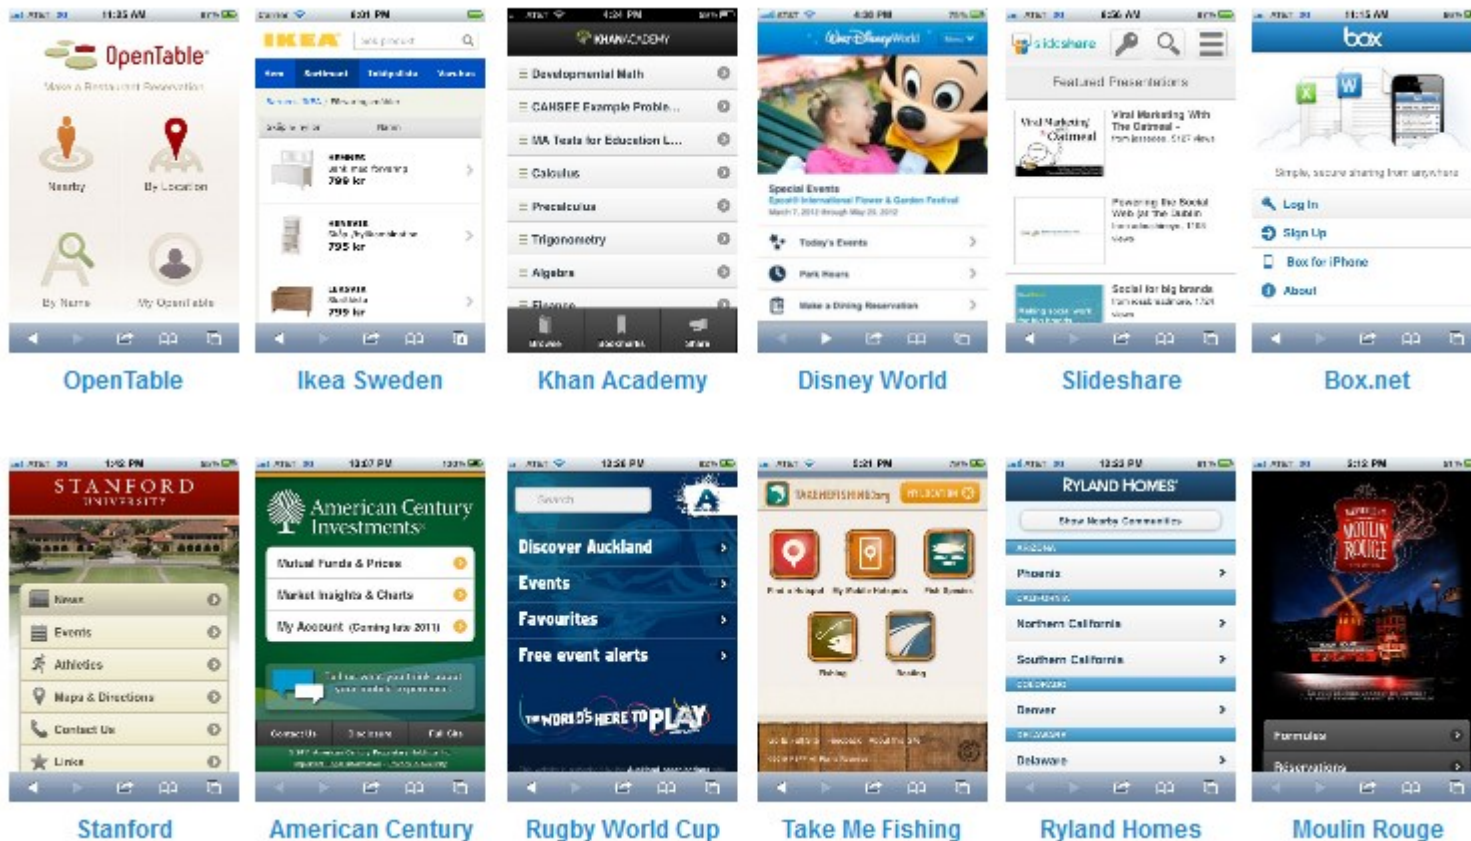

25

Slider:

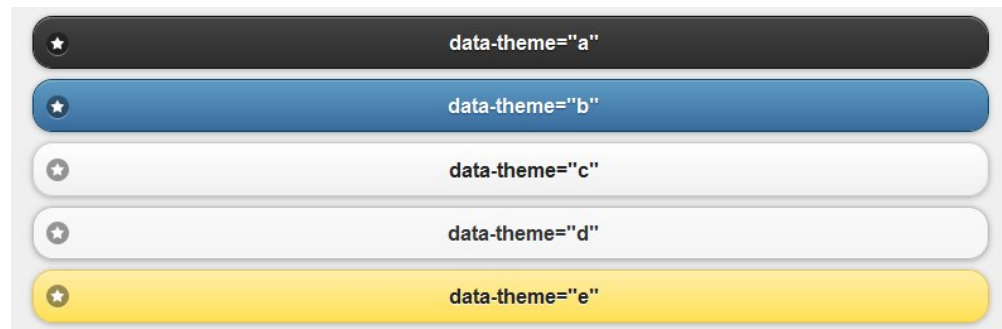

# Browser support

- Browsers
  - **A-grade** Full jQuery Mobile Support
  - **B-grade** Almost full support, no AJAX navigation
  - **C-grade** Non-enhanced HTML experience
- Browsers' support
- <https://jquerymobile.com/browser-support/1.4/>

# jQuery mobile in the real world

# jQuery Mobile Widgets

# Anatomy of a page

```
<!DOCTYPE html>
<html>
<head>
 <title>Sample0 - Skeleton</title>
 <meta name="viewport" content="width=device-width, initial-scale=1">
 <link rel="stylesheet" href="http://code.jquery.com/mobile/1.4.3/jquery.mobile-1.4.3.min.css" />
 <script src="http://code.jquery.com/jquery-1.11.1.min.js"></script>
 <script src="http://code.jquery.com/mobile/1.4.3/jquery.mobile-1.4.3.min.js"></script>
</head>
```

Viewport  
CSS  
JavaScript

```
<body>
 <div data-role="page">
 <div data-role="header">
 <h1>Header</h1>
 </div>

 <div data-role="content">
 <p>Body</p>
 </div>

 <div data-role="footer">
 <h5>Footer</h5>
 </div>
 </div>
</body>
</html>
```

Header

Content

Footer

CREATE YOUR FIRST  
JQUERY MOBILE PAGE AND  
OPEN IT IN GOOGLE  
CHROME AND THEN IN A  
MOBILE DEVICE

---

# Data roles

- Markup elements can have roles (`data-role`)
- They add semantics to the document
- They permit also to add attributes to tags while maintaining valid documents
- They are implicit contracts between the framework and the developers
- `data-role` **include** `page`, `header`, `content`, `footer`, `navbar`, `button`, `controlgroup`, `collapsible`, `collapsible-set`, `fieldcontain`, `listview`, `dialog`, `slider`, `nojs`
- <http://api.jquerymobile.com/data-attribute/>

# Data attributes

- Each UI component has data attributes associated to it
- Data attributes (`data-*`) permit to initialize and configure widgets
- <http://api.jquerymobile.com/data-attribute/>

# Button

```
Click me!
```

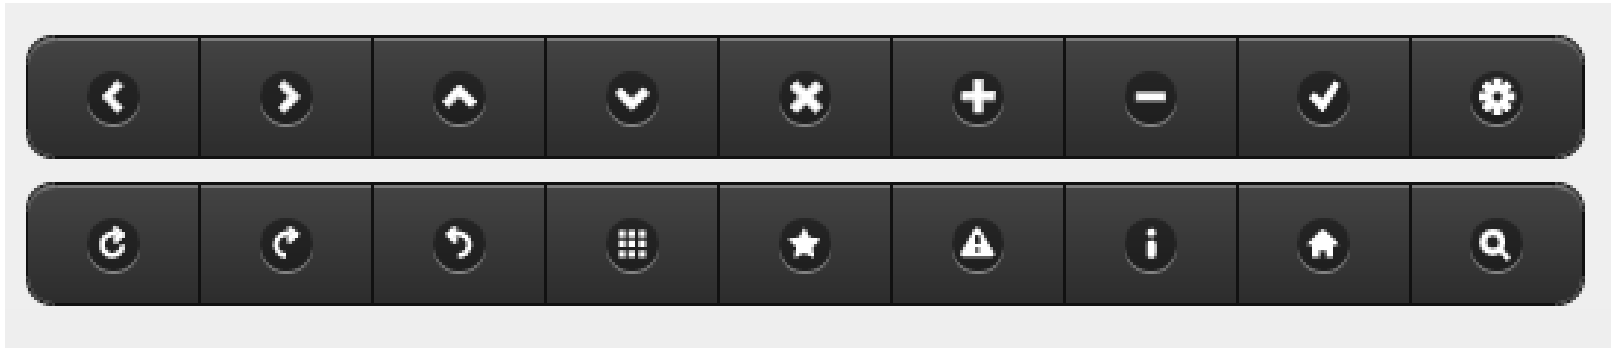

# Button with an icon

```
<a href="#" data-role="button" data-
icon="arrow-u">Click me!
```

<b>data-corners</b>	<b>true</b>   false
<b>data-icon</b>	home   delete   plus   arrow-u   arrow-d   check   gear   grid   star   custom   arrow-r   arrow-l   minus   refresh   forward   back   alert   info   search
<b>data-iconpos</b>	<b>left</b>   right   top   bottom   notext
<b>data-iconshadow</b>	<b>true</b>   false
<b>data-inline</b>	true   <b>false</b>
<b>data-mini</b>	true   <b>false</b> - Compact sized version
<b>data-shadow</b>	<b>true</b>   false
<b>data-theme</b>	swatch letter (a-z)

# Icons

# Listview

```
<ul data-role="listview">
 NYC
 Boston
 San Francisco

```

# Listview

```
<ul data-role="listview" data-inset="true" data-filter="true">
 NYC
 Boston
 San Francisco

```

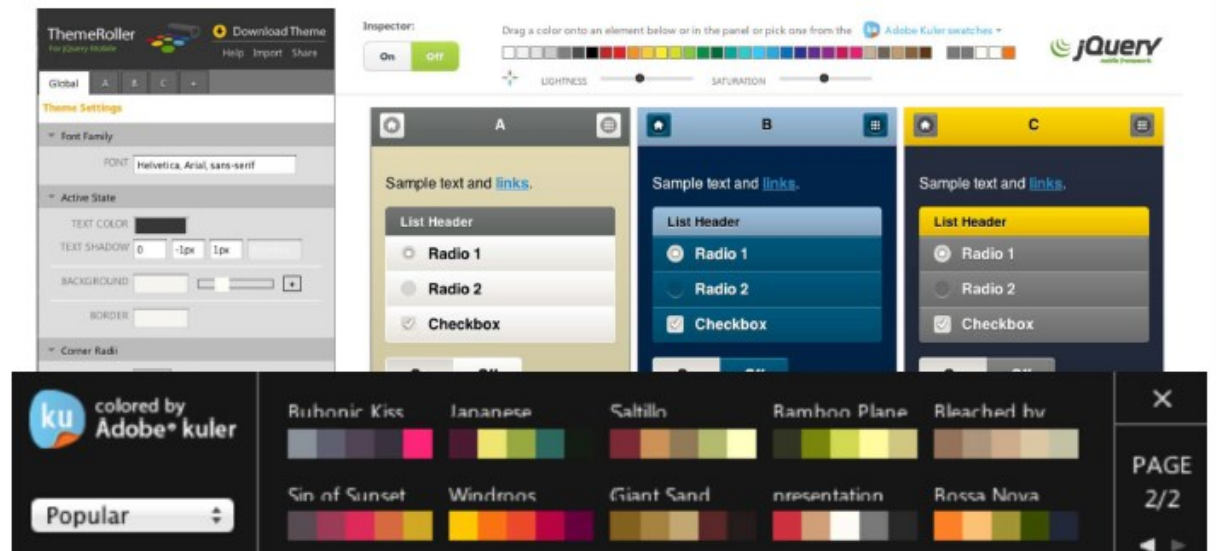

<b>data-autodividers</b>
<b>data-count-theme</b>
<b>data-divider-theme</b>
<b>data-filter</b>
<b>data-filter-placeholder</b>
<b>data-filter-theme</b>
<b>data-header-theme</b>
<b>data-inset</b>
<b>data-split-icon</b>
<b>data-split-theme</b>
<b>data-theme</b>

# Themes

- Introduced with the `data-theme` attribute and the letters a, b, c and d...
- Can be customized using ThemeRoller
  - <http://jquerymobile.com>

# Multiple pages navigation

Pages have  
unique ids

```
<body>
 <div data-role="page" id="page1" data-theme="a"> ...
 <div data-role="page" id="page2" data-theme="b"> ...
</body>
```

Going to a particular page:

```
Two
```

# Navigation

```
Here
```

```
Here
```

```
Here
```

```
Here
```

Your files need to be on  
a server

slide

slideup

slidedown

pop

fade

flip

# Tabs

- A navbar widget is available with up to 5 tabs
- It is placed within the header or the footer
- It is defined using the data-role `navbar` and an unordered list (`<ul> ... </ul>`)

```
<div data-id="navig" data-role="navbar">

 <a href="#page1" class="ui-btn-active ui-state-persist"
 data-icon="home">One
 Two

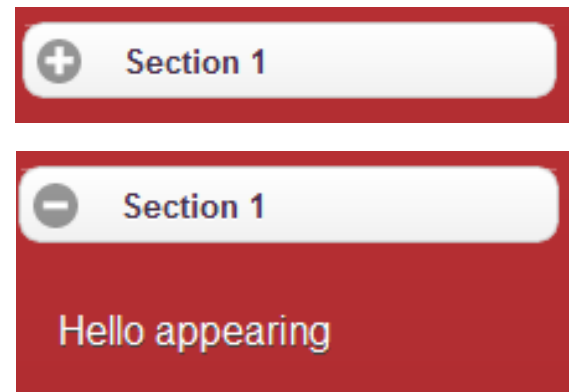

</div>
```

- To initialize the state of the tab and restore it each time you come back to the page, use `class= "ui-btn-active ui-state-persist"`
- `data-id` permits to fix the navigation bar outside a transition and create a persistent navigation bar

# Collapsibles

- Collapsibles are defined using the data-role collapsible container
- They are composed of a header (using h1 to h6) and then any HTML code
- data-collapsed permits to set the state of the collapsible to close (true) or open (false)

```
<div data-role="collapsible" data-mini="true">
 <h3>Section 1</h3>
 <p>Hello appearing</p>
</div>
```

# Collapsible sets (Accordion)

- Collapsible sets permit to group widgets and make them behave like an accordion (so only one section can be open at a time)

```
<div data-role="collapsible-set">
 <div data-role="collapsible" data-collapsed="false">
 <h3>Section 1</h3>
 <p>I'm the collapsible set content for section B.</p>
 </div>

 <div data-role="collapsible">
 <h3>Section 2</h3>
 <p>I'm the collapsible set content for section B.</p>
 </div>

 <div data-role="collapsible">
 <h3>Section 3</h3>
 <p>I'm the collapsible set content for section B.</p>
 </div>
</div>
```

# Forms

- Forms are wrapped into a form tag with attributes action and method

```
<form action="form.php" method="post or
get">
```

...

```
<input type="submit" name="mysubmit"
value="Submit" />
```

```
</form>
```

- Forms are composed of different UI components introduced by labels

```
<label for="nameid">Name:</label>
```

```
<input type="text" name="name" id="nameid" required />
```

# Forms

- All the UI elements of a form are contained in a `fieldset` to present the elements conveniently on the screen

```
<fieldset>
```

```
...
```

```
</fieldset>
```

- To improve the look-and-feel of a form each pair (label, UI component) should be in a `div` tag with data-role called `fieldcontain`

```
<div data-role="fieldcontain">
 <label for="nameid">Name:</label>
 <input type="text" name="name" id="nameid" required />
</div>
```

# Text inputs

```
<div data-role="fieldcontain">
 <label for="nameid">Name:</label>
 <input type="text" name="name" id="nameid" required />
</div>
```

- The type of the text can be:
  - text, password, email, tel, url, search, number, date, datetime, time, datetime-local, month, week
- To require a value, use the `required` attribute
- To provide a value by default, use the `placeholder` attribute

```
<div data-role="fieldcontain">
 <label for="ageid">Age:</label>
 <input type="number" name="agename" id="ageid" required placeholder="21" />
</div>
```

# SHOWCASE OF THE DIFFERENT UI ELEMENTS

---

# Panels

- Panels are defined using *data-role*
- *data-position* defines the position of the panel – left or right
- *data-display* determines the way the panel will be displayed - reveal, overlay or push

```
<div data-role="panel" id="myPanel">
 <h2>Menu...</h2>
 <p>Menu 1</p>
 <p>Menu 2</p>
 <p>Menu 3</p>
</div>
```

# Panels

- To open a panel, the reference points on the panel

```
<div data-role="header">
 <h1>Standard Page Header</h1>
 Open panel
</div>
```

- To close a panel, one clicks on the same element that opened the panel

```
<div data-role="panel" id="myPanel">
 <h2>Menu...</h2>
 <p>Menu 1</p>
 <p>Menu 2</p>
 <p>Menu 3</p>
 <a href="#pageone" data-rel="close"
 class="ui-btn ui-btn-inline ui-shadow ui-corner-all ui-btn-a ui-icon-delete ui-btn-icon-left">
 Close panel

</div>
```

# Adding scripts to a page

For adding JavaScript to the page

Waits for the HTML to load

```
<script>
$(document).ready(function() {
 // your programming
});
</script>
```

For event management

```
<meta name="viewport" content="width=device-width, initial-scale=1">
<link rel="stylesheet" href="jquery.mobile-1.1.1.min.css" />
<script src="jquery-1.7.1.min.js"></script>
<script>
$(document).bind("mobileinit", function() {
 $.mobile.listview.prototype.options.filterPlaceholder = "Affiner la recherche ... ";
});
</script>
<script src="jquery.mobile-1.1.0.min.js"></script>
```

`$('#selector').bind('event',myData, functionName)`

# Removing elements from a page

```
<script type="text/javascript">

$(document).ready(function () {

 $('ul[data-role="listview"]').find('li').click(function()
 {
 $(this).remove();
 });

});

</script>
```

```
<body>
<div data-role="page">
 <div data-role="header">
 <h1>Suppression d'un élément d'une liste</h1>
 </div>
 <div data-role="content">
 <ul data-role="listview" data-inset="true" data-filter="true"
 data-filter-placeholder="Rechercher votre équipe....">
 <li data-role="list-divider">MBour
 Atlantic
 Chades
 Dexele
 <li data-role="list-divider">Thiès
 Botafogo
 Carre bi
 Grand Thiès

 </div>
 <div data-role="footer">
 <h5>SenMobile</h5>
 </div>
</div>
</body>
```

# Maps - Configurations

- We need a plugin to use maps and interact with them in jQuery Mobile
  - Google maps v3 plugin for jQuery and jQuery Mobile
  - <http://code.google.com/p/jquery-ui-map/>
- In the head of the HTML document we add the required scripts

```
<link rel="stylesheet"
 href="http://code.jquery.com/mobile/1.1.0/jquery.mobile-1.1.0.min.css" />
<script src="http://maps.google.com/maps/api/js?sensor=true"
 type="text/javascript"></script>
<script src="http://code.jquery.com/jquery-1.7.2.min.js"></script>
<script
 src="http://code.jquery.com/mobile/1.1.0/jquery.mobile-1.1.0.min.js"></script>
<script src="js/ui/jquery.ui.map.js" type="text/javascript"></script>
```

- We are ready to go!
